Digital Literacy Project Report

Course Code: CSE0001
Course Title: Digital Literacy
Name: Yash Rao Patankar
Registration Number: 25MIP10105
Branch: Integrated MTech
Year: First Year
Submission Date: 31/03/2026

Introduction-

In today's world, digital technology plays a central role in education, communication, and career development. As students, we regularly use various online tools but using them effectively and responsibly requires digital literacy. This project was designed to help understand how to build a professional digital presence, communicate appropriately online, collaborate using digital platforms, and stay aware of common cyber threats.

As a Student Digital Ambassador, the objective was to create useful resources and examples that can guide peers in navigating the digital environment responsibly. The project consists of five modules, each focusing on an important aspect of digital literacy awareness, portfolio building, collaboration tools, communication etiquette, and cybersecurity. Through this project, practical skills were developed along with a better understanding of responsible digital behavior and online presence.

Task1 - Digital Literacy Awareness Infographic-

For this task, Canva was used to create a one-page infographic on Digital Literacy Awareness. Canva was selected due to its simple interface, variety of templates, and availability of icons and design elements that support clear visual presentation. The infographic focuses on three main topics: the meaning of digital literacy, safe internet practices, and maintaining a professional online presence.

Digital literacy was presented as more than just the ability to use devices; it also involves understanding online risks, practicing responsible communication, and following ethical behavior online. The infographic includes key tips such as using strong passwords, verifying information before sharing, and maintaining respectful communication. Visual icons and simple color coding were used to improve clarity and make the information easy to understand quickly.

One challenge in this task was selecting the most relevant information while keeping the design simple and uncluttered. The process highlighted how visual presentation can influence how effectively information is understood and remembered. This task helped develop an understanding that digital awareness content should be both informative and visually clear to be effective.

Task 2 Digital Portfolio-

In this task, profiles were created or updated on GitHub, LinkedIn, and HackerRank to establish a basic professional digital presence. GitHub is used to showcase coding projects and technical work, LinkedIn serves as a professional networking platform, and HackerRank helps demonstrate problem-solving ability through coding challenges.

On GitHub, a profile README was created including basic details such as name, branch, academic year, and the goal of developing strong programming skills during the degree. On LinkedIn, education details were added, including the current program and institution. Together, these platforms form a foundation that can support future internship and career opportunities.

Over the next few years, coding projects can be regularly uploaded to GitHub, professional connections can be built on LinkedIn, and consistent practice on HackerRank can help strengthen technical skills. Creating these profiles early allows gradual improvement instead of rushing before placements. This task highlights that a professional digital identity develops over time through continuous effort and learning.

Task 3 Platforms-

For this task, both a coding practice platform and a collaboration tool were explored. An account was created on HackerRank, and a beginner-level challenge was completed. This platform helps improve logical thinking and programming skills through structured problems and instant feedback. Attempting even a basic challenge provided familiarity with the format commonly used in technical assessments.

For collaboration, a Google Form was created as a Digital Literacy Awareness quiz for classmates. The form included five questions using formats such as multiple-choice and short answers. The automatically generated Google Sheet of responses was also reviewed, showing how data can be collected and organized efficiently.

These tools are useful for academic and professional growth. Coding platforms support preparation for technical exams and placements, while collaboration tools help in conducting surveys, collecting feedback, and managing group activities. This task demonstrated how digital platforms can support both individual learning and collaborative work.

Task 4 Communication Scenario-

Poor digital communication can lead to misunderstandings and may negatively affect professional relationships. A common example is when a student sends an informal or incomplete email to a professor requesting an extension. If the message lacks a proper subject line, respectful tone, or clear explanation, it may appear careless and reduce the chances of receiving a positive response.

A more appropriate approach is to include a clear subject line, use formal addressing, briefly explain the reason for the request, and express appreciation for the recipient’s time and consideration. Professional communication reflects responsibility and respect.

This task highlighted the importance of adjusting communication style based on the situation. Informal language may be acceptable in casual conversations, but academic and professional interactions require clarity, structure, and courtesy. Developing this skill early can be beneficial for future academic and career opportunities.

Task 5 Cybercrime Reflection-

.

While researching cyberbullying, it became clear how common negative online behavior has become and how seriously it can affect individuals. Cyberbullying often includes harassment, spreading rumors, sharing private information without consent, or posting hurtful comments on social media and messaging platforms. Unlike offline situations, harmful content online can spread quickly and remain visible for a long time, making the impact more serious.

This research showed that awareness alone is not enough; responsible online behavior is equally important. One important habit to follow is thinking carefully before posting or sharing content and ensuring that communication remains respectful. It is also important to avoid engaging with harmful messages and instead report such behavior through proper channels.

Understanding cyberbullying is essential for students because online platforms are a major part of academic and social life. Maintaining respectful communication and acting against harmful behavior can help create a safer and more supportive digital environment for everyone.

Conclusion-

This project provided a broader understanding of digital literacy beyond basic technical knowledge. It showed how professional identity, communication, collaboration, and online safety are closely connected in today's digital environment. Through these tasks, practical experience was gained in creating professional profiles, using learning platforms, designing awareness content, and practicing responsible online behavior.

As a Student Digital Ambassador, there is now greater confidence in guiding peers toward safe and effective use of technology. The project also highlighted that digital literacy is not a one-time skill but a continuous process that involves awareness, critical thinking, and regular improvement.
